OSS Developer with 1+ years of experience. Explore my open-source projects and libraries on GitHub.

Education

Bachelor of Computer Applications · Tilak Maharashtra Vidyapeeth (TMV) · Pune, India · CGPA: 7.5/10

2024 - 2028

Skills

Languages	TypeScript, JavaScript, Golang
Frameworks	React, Next.js, Tailwind CSS, Gin (Go)
DevOps	Docker, GitHub Actions, Linux, Nix, NixOS
DB & Tools	PostgreSQL, Git, CMake, Shell Scripting, LaTeX

Experience

OWASP BLT · Open Source Contributor | Remote

2025 - 2026

- Migrated OWASP BLT from Poetry to UV across pyproject.toml, Dockerfile, and CI workflows, cutting dependency install and environment setup time for all contributors.
- Optimized the Docker development environment for UV-based dependency management with faster container builds in local and CI workflows.
- Reviewed and merged pull requests from new contributors, upholding code quality standards across the project.

Projects

HaruStream · Anime & Movie Streaming - Next.js, TypeScript

- Built a full-stack Next.js platform for streaming anime, movies, and web series with server-side search.
- Integrated Vidstack player with custom playback controls, episode navigation, and watch-progress tracking.
- Hardened external API consumption with Zod runtime validation and structured Pino logging.

Android Tweaker · Android Kernel Optimizer - Kernel Profiles

- Developed a Magisk/KernelSU/APatch module applying CPU governor and kernel tweaks at boot, adopted by 2,000+ subscribers across custom ROM communities.
- Packaged a self-installing companion app with multi-arch support and boot-settle startup safeguards.
- Earned 68 GitHub stars and 23 forks with community-driven iteration across ROM releases.

CoreTaskOptimizer · Boot-time Task Prioritizer - C++

- Developed a C++ root module applying CPU affinity, SCHED_FIFO, and I/O priority policies via direct syscalls.
- Uses runtime CPU topology detection to pin critical threads on performance versus efficiency cores.
- Runs once at boot for zero persistent overhead; earned 51 GitHub stars with automated multi-ABI builds.

TermChat · Terminal Chat Application - Rust, Tokio

- Built a real-time terminal UI chat client in Rust with Ratatui and crossterm for responsive rendering.
- Implemented async TCP networking on Tokio with a custom framing codec for concurrent message handling.
- Added structured logging and robust error handling with tracing and anyhow across async tasks.

Achievements

Open Source Contributor

Holopin: @c0d3h01

Hacktoberfest - 2025 · 12 merged pull requests

October 2025

- Completed Hacktoberfest 2025 with 12 merged PRs into Obfuscator, a cross-platform C/C++ LLVM obfuscator.
- Shipped CI pipeline fixes, mdBook documentation infrastructure, and an Angular-to-Svelte frontend migration.
